

Positive Technologies

Creating a fuzzer for **telecom protocol**

4G LTE case study

Sergey Mashukov

positive-tech.com

::: SS7 now

More than **50 different SS7** attacks:

- IMSI disclosure
- Location discovery
- Subscriber DoS
- SMS interception and spoofing
- Call interception
- Reading of Telegram and WhatsApp chats

::: Diameter now

	SS7	Diameter
Interception	+	+
Tracking	+	+
DoS on subscriber	+	+
DoS on network equipment	+	+
Fraud	+	+

Positive Technologies Diameter

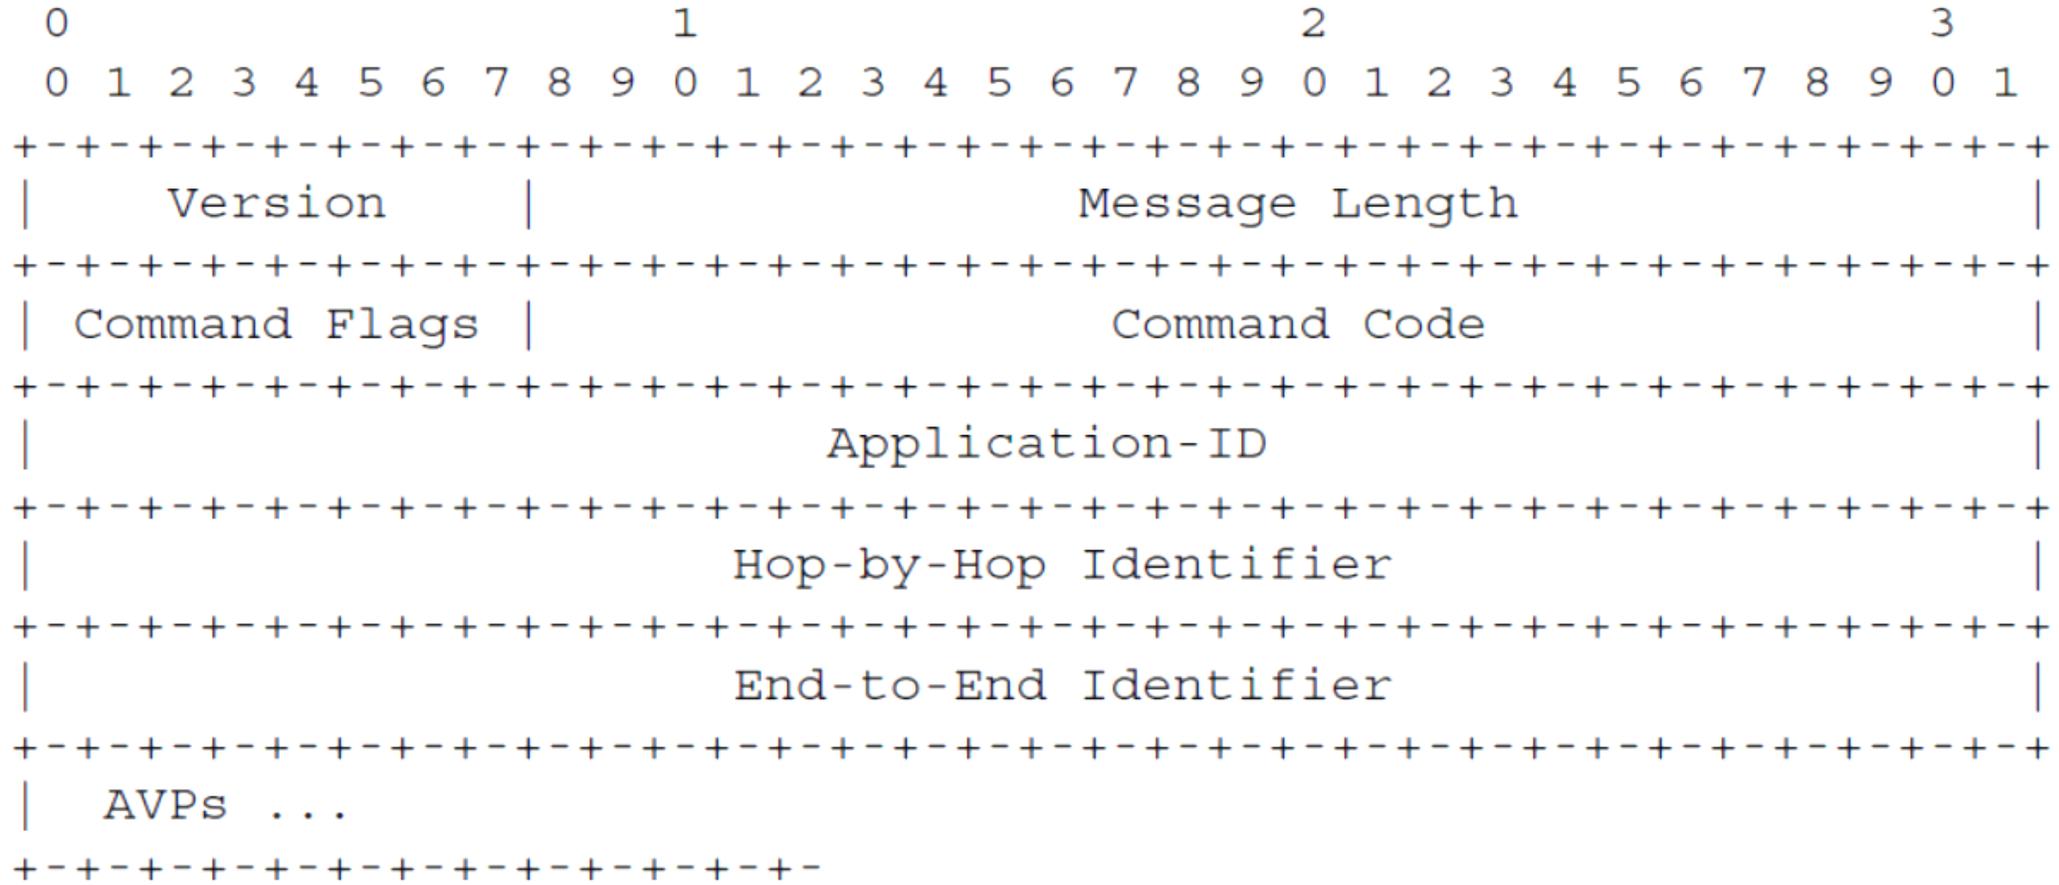

- Diameter = **RADIUS x 2**
- Remote Authentication Dial-In User Service (RADIUS) is a networking protocol that provides centralized Authentication, Authorization, and Accounting management for users who connect to and use a network service

Positive Technologies Diameter

- Session-layer AAA protocol
- Cleartext
- Support for SCTP or TCP
- IPsec or TLS/DTLS for encryption
- Extensibility
(Diameter Base and Applications on top of it)

▸ AVP: Subscription-Data(1400) l=32 f=VM- vnd=TGPP

:: Diameter in LTE

■ ■ Fuzzing

According to Wikipedia:

"Fuzzing or fuzz testing is an automated software testing technique that involves providing invalid, unexpected, or random data as inputs to a computer program.

The program is then monitored for exceptions such as crashes, failing built-in code assertions, or potential memory leaks."

```
▲ Diameter Protocol
  Version: 0x01
  Length: 260
  ▶ Flags: 0x60, Proxyable, Error
  Command Code: 316 3GPP-Update-Location
  ApplicationId: 3GPP S6a/S6d (16777251)
  Hop-by-Hop Identifier: 0x5d1edd22
  End-to-End Identifier: 0x1d2622d6
  [Request In: 18802]
  [Response Time: 0.004907177 seconds]
  ▶ AVP: Session-Id(263) l=36 f=-M- val=
  ▶ AVP: Vendor-Specific-Application-Id(

        AVP Length: 23
        ▶ AVP Vendor Id: Unknown (926037040)
          Value:
          Padding: 00
      ▶ AVP: Proxy-Info(284) l=88 f=-M-
```

∴ Fuzzing

Two things are needed:

- Software to perform the test
- A way to check and interpret the results

:: Fuzzing of **telecom equipment**

- Normally should be done by vendors, but often overlooked
- No access to hardware or code for security community => bugs are present
- In our experience with fuzzing assessments, more than half of tested equipment has vulnerabilities
- Bugs may lead to serious consequences

::: **Correctly formed messages may cause the same impacts**

- **Outage on February 19, 2016**
- **More than 3.5 hours**
- **More than 1 million subscribers**

:: RCE on host

- Vulnerabilities found during fuzzing may be exploited to perform **Remote Code Execution attacks**
- Successful RCE may lead to adversary **gaining control over the Network Element** to perform further attacks on this or other MNO networks

Where to test

Vendor's Lab

Operator's Lab

Live Network

Positive Technologies

::: Test lab usually is **different from network**

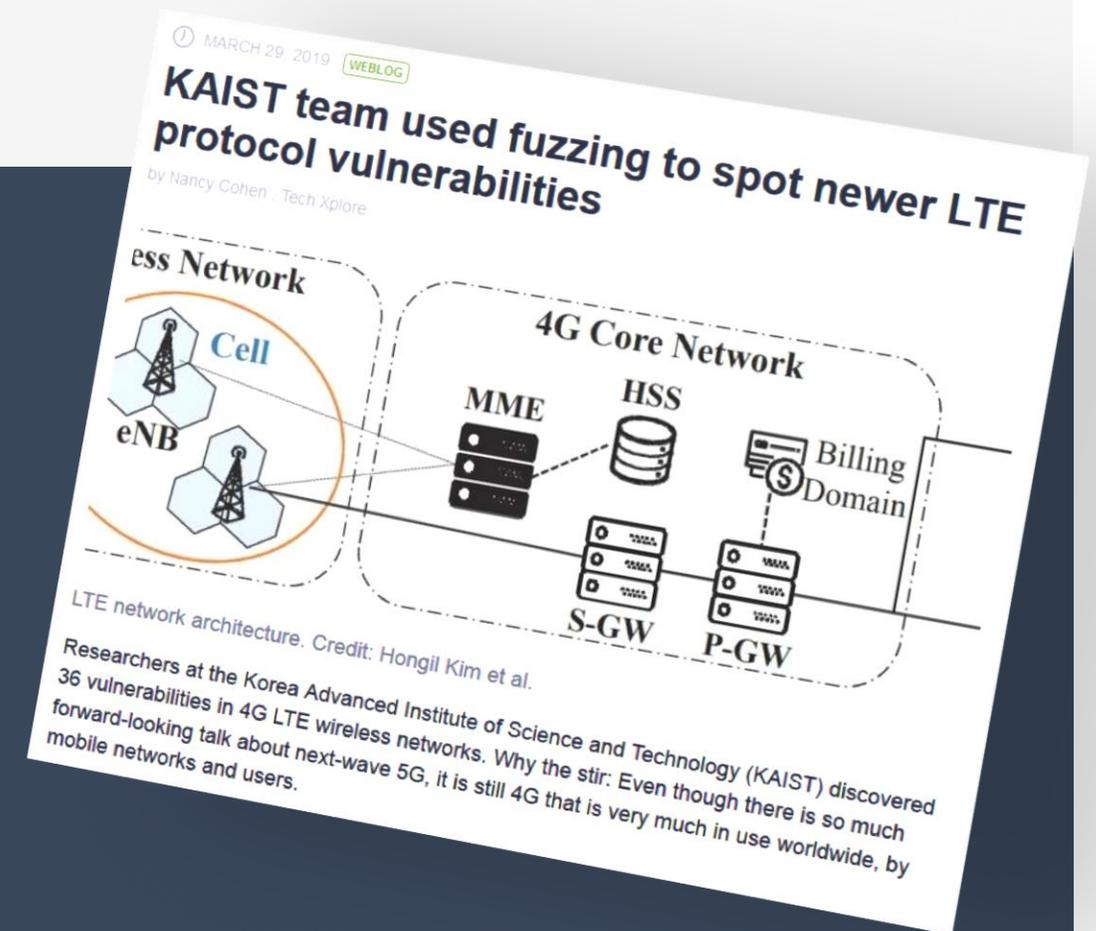

Different configuration of UE and Network Equipment:

- Non-standard identifiers are used
- Routing is always different

Nodes should be configured as in real
life or else some cases won't be tested

Recent Case

- "Touching the Untouchables: Dynamic Security Analysis of the LTE Control Plane" by KAIST
- 51 vulnerabilities were found
- Problems found through fuzzing may be overlooked by vendors
- Not all found problems may be exploitable in the wild

:: DEA as a **single point of connection**

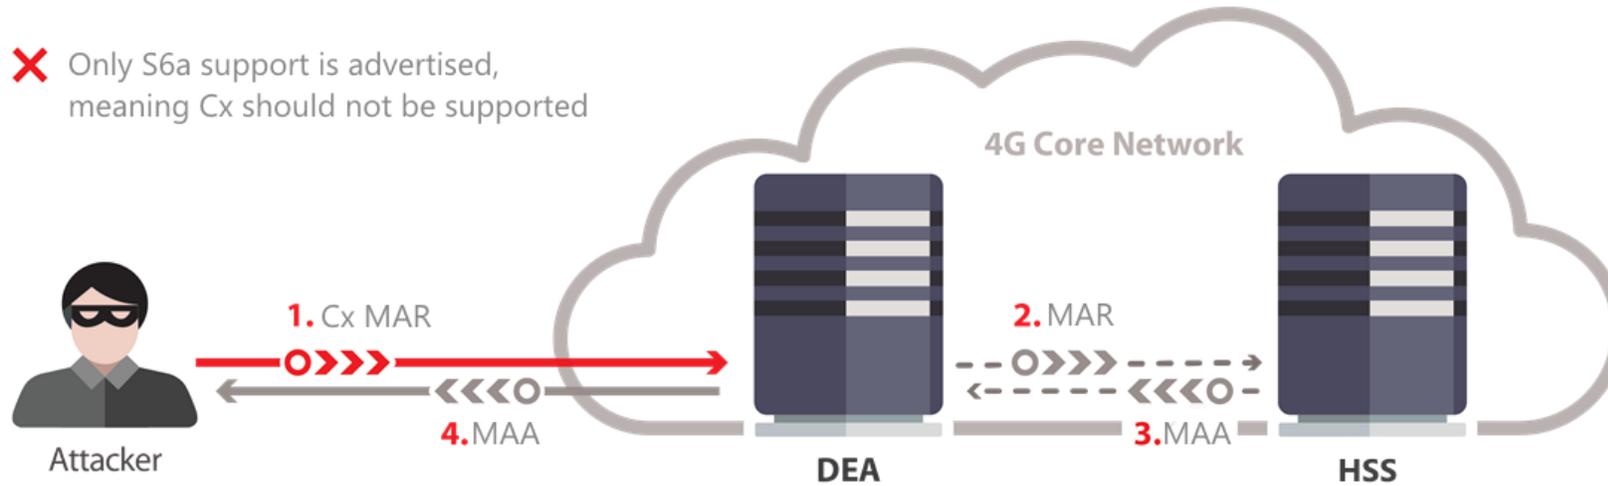

- To exploit vulnerabilities, malefactor most likely should have control over direct IP connection
- In some cases, these vulnerabilities may be usable from IPX
- Access to IPX can be bought

::: DEA as a **single point of connection**

- Diameter Edge Agent (DEA) is a router for Diameter messages coming from IPX
- May also route internal traffic
- Presents a single point of failure

::: DEA ignoring configuration

✗ Only S6a support is advertised, meaning Cx should not be supported

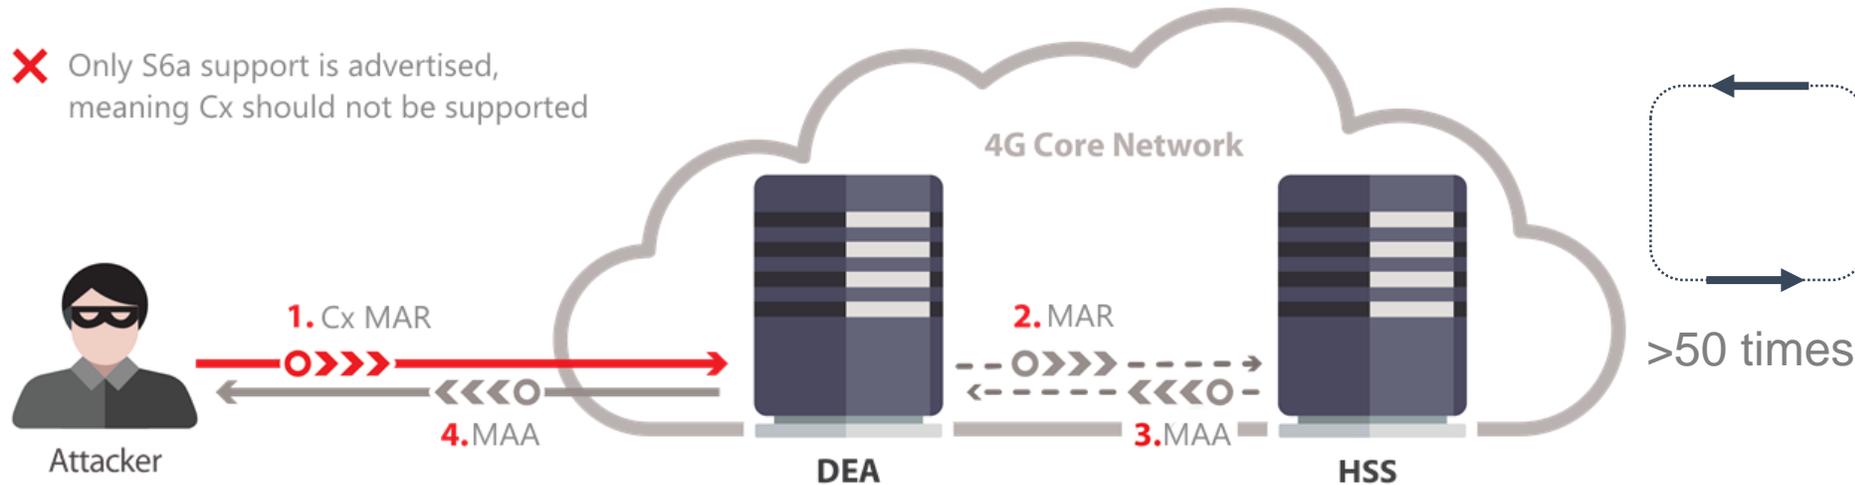

Messages:

MAR – Multimedia-Auth-Request (Cx)

MAA – Multimedia-Auth-Answer (Cx)

::: Attack on HSS through **the DEA**

- Diameter connection is dropped on HSS
- Burst of messages
- Works both directly and through DEA

∴ Why separate telecom **fuzzer** is needed

- Need to communicate with tested equipment through network
- Specific message structure and data types
- Having source code allows flexibility on-site if new functionality is needed

:: Existing protocol implementations

Problems with:

- Creating malformed messages
- Breaking correct message order
- Testing on Diameter Base level
 - Connection establishment
 - Answers

**Usually
commercial
protocol stacks
are not suited
for fuzzing**

:: How to fuzz

- Two kinds of malformed messages:
 - Wrong from encoding perspective
 - Wrong from semantics perspective (e.g., fields that should not be present in the message)
- You need messages that are somewhat similar to "real" ones to cover both types
- You need to isolate the problem to report and fix it

```
▼ Diameter Protocol
  Version: 0x01
  Length: 611
  ▶ Flags: 0xc0, Request, Proxyable
  Command Code: 319 3GPP-Insert-Subscriber-Data
  ApplicationId: 3GPP S6a/S6d (16777251)
  Hop-by-Hop Identifier: 0x5d5c39e0
  End-to-End Identifier: 0x1cf00000
  ▶ AVP: User-Name(1) l=10 f=-M- val=11
  ▶ AVP: User-Name(1) l=10 f=-M- val=22
  ▶ AVP: User-Name(1) l=10 f=-M- val=33
  ▶ Wrong AVP(277) length 555
  ▶ [Malformed Packet: DIAMETER]
```

:: How to fuzz

Mutating messages

- You might need some sample messages to mutate
- Values should reflect specifics of configuration of the network to create "similar" identifiers during fuzzing (host names, IPs, etc.)

:: What kind of mutations to use

Mutating headers:

- Random bit flips
- Pre-set values

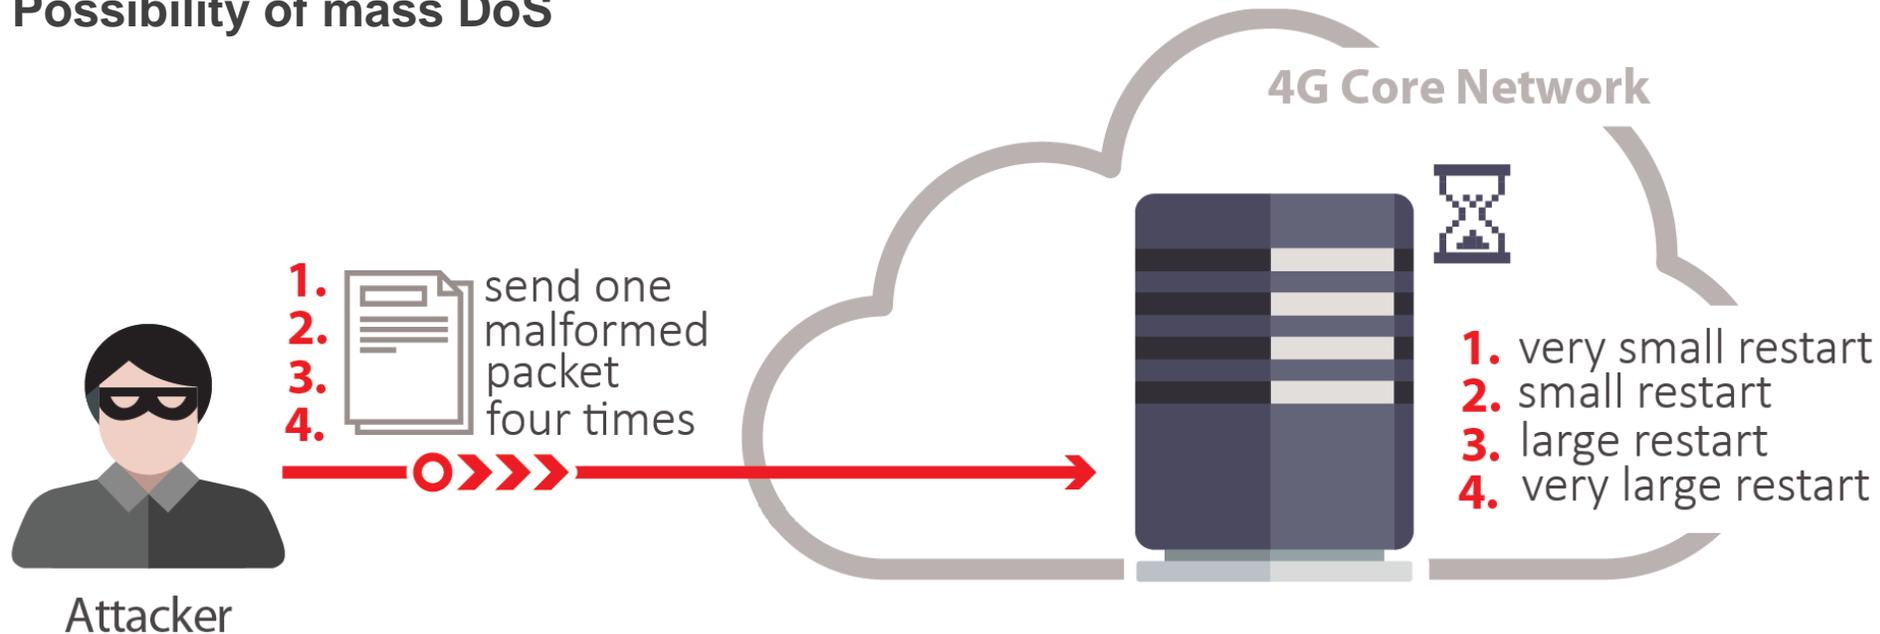

Mutating AVP values:

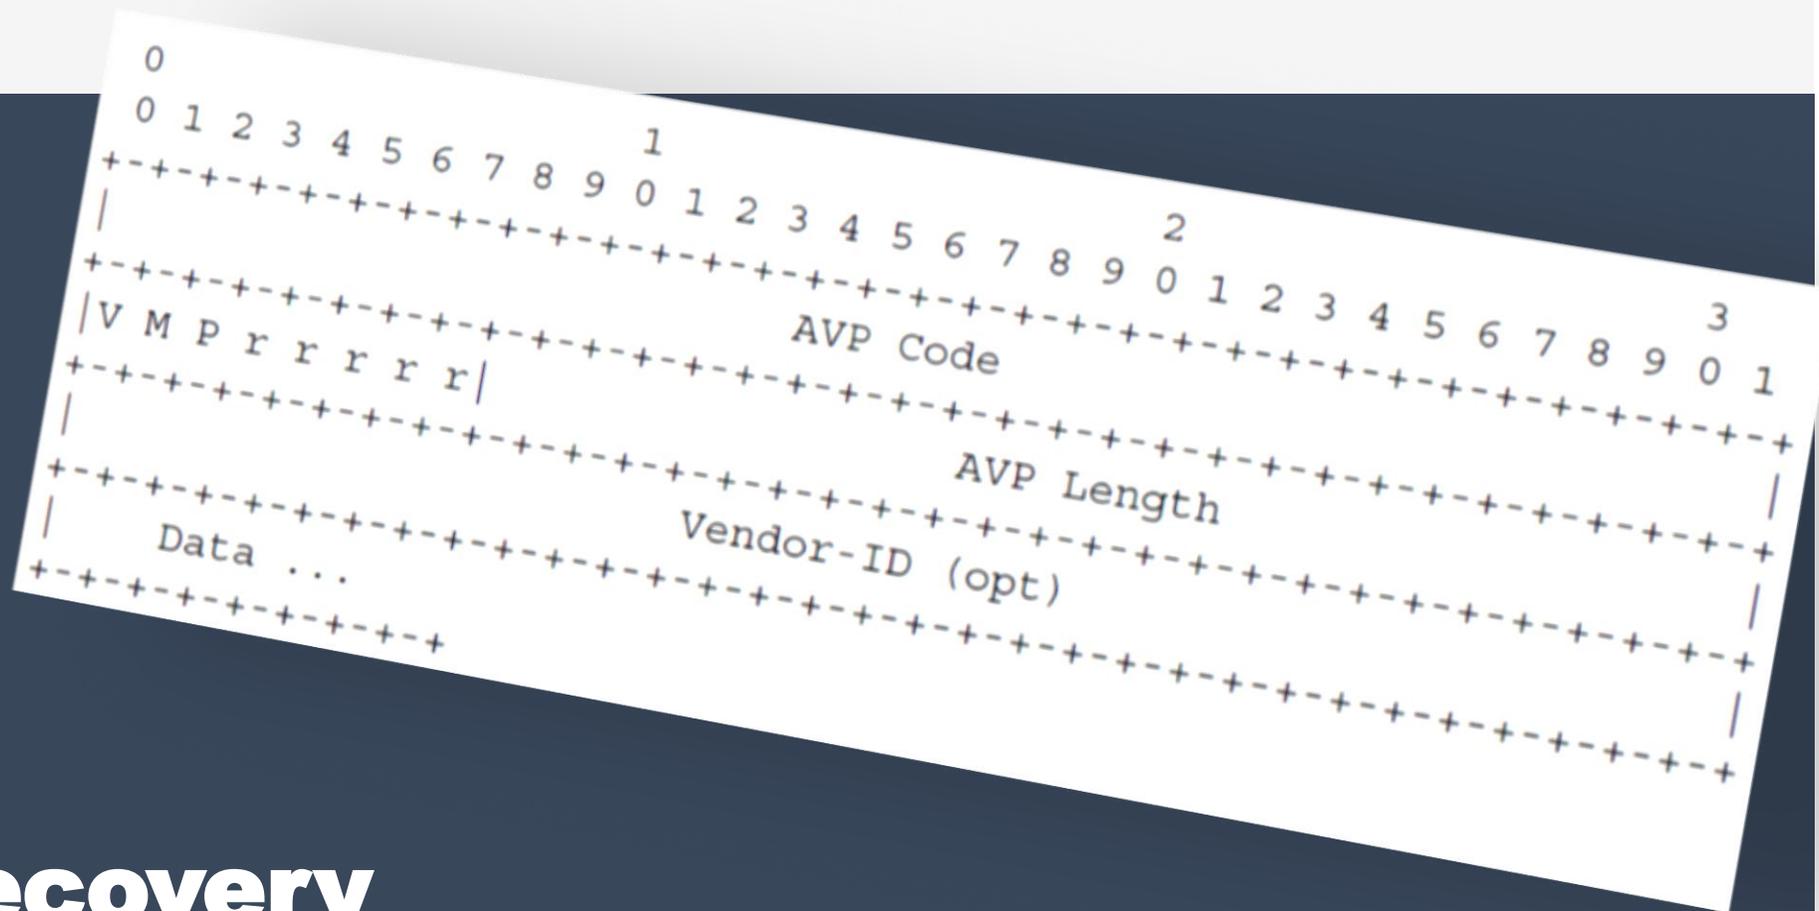

- Random bit flips
- Pre-set values specific to AVP type
- Random appends and removals for variable-length AVP types
- Changes in message structure for grouped AVPs

::: DoS: Recovery mechanism from attacker side

- MME restarts
- Problem in Diameter parsers
- Possibility of mass DoS

DoS: Recovery mechanism from attacker side

V-bit is used to determine whether the 4-byte Vendor-Id field should be present in the AVP header.

Blacklisting values

Adapt your fuzzer to the operating conditions:

- Test lab may be used for other tests
- It even may be connected to international network

Blacklisting of some values, since operators don't want to stop work in test lab (especially true for network elements doing routing such as Diameter Routing Agent)

∴ Problems implementing **the fuzzer**

- It is almost impossible to do exhaustive testing due to possible number of combinations and extensibility of protocols
- So the faster we fuzz, the better

:: Speeding up **the fuzzing process**

Study the protocol to see where you can speed up fuzzing

Two kinds of mutations are possible for Diameter:

- Mutations that affect length of the message
(length field in headers, data of variable-length AVPs or message structure)
- Mutations that don't affect the length

If length is not affected, there are no changes in binary structure and padding, so fuzzing may be performed on the encoded message

:: Mutations in length

Two ways to mutate with length changes:

- Updating all headers in the message appropriately
- Without changes to the length fields

::: DEA restarts

Nested AVPs with wrong AVP Length field in the parent

To:

```
AVP: Vendor-Specific-Application-Id(260) l=32 f=-M-  
  AVP Code: 260 Vendor-Specific-Application-Id  
  AVP Flags: 0x40, Mandatory: Set  
  AVP Length: 0  
  Vendor-Specific-Application-Id: 0000010a4000000c000028af000001024000000c01000023  
    AVP: Vendor-Id(266) l=12 f=-M- val=10415  
    AVP: Auth-Application-Id(258) l=12 f=-M- val=3GPP S6a/S6d (16777251)
```

From:

```
AVP: Vendor-Specific-Application-Id(260) l=32 f=-M-  
  AVP Code: 260 Vendor-Specific-Application-Id  
  AVP Flags: 0x40, Mandatory: Set  
  AVP Length: 32  
  Vendor-Specific-Application-Id: 0000010a4000000c000028af000001024000000c01000023  
    AVP: Vendor-Id(266) l=12 f=-M- val=10415  
    AVP: Auth-Application-Id(258) l=12 f=-M- val=3GPP S6a/S6d (16777251)
```

:: Parsing **error answers**

Your program may need to work both as fuzzer and as a legitimate peer

In answers, Failed-AVP may contain malformed data sent to the test node -> do not decode answer messages, or your own implementation might crash

So you might **need to be able to parse the messages** that are coming back from the network

It is better to have configurable parsing since sometimes you need to parse what is received and sometimes not

∴ Handling connections and sessions

- You need to be able to set up correct connection or even start a session first
- You also don't want to break the connection by changing message type to Disconnect-Peer-Request
- Test messages that break the connection in separate scope

Problems implementing **the fuzzer**

-
- To properly test answer messages or set up the session, you need to emulate requests at a certain rate
 - You also need to update hop-by-hop and end-to-end
 - Ask MNO for emulators if needed
 - Create your own, it might help with development

::: Reproducing **issues**

Keep an eye on system time on different nodes

Save the random seed for reproductions

Sometimes it may be **better to reproduce** with different random seed to get the same error faster

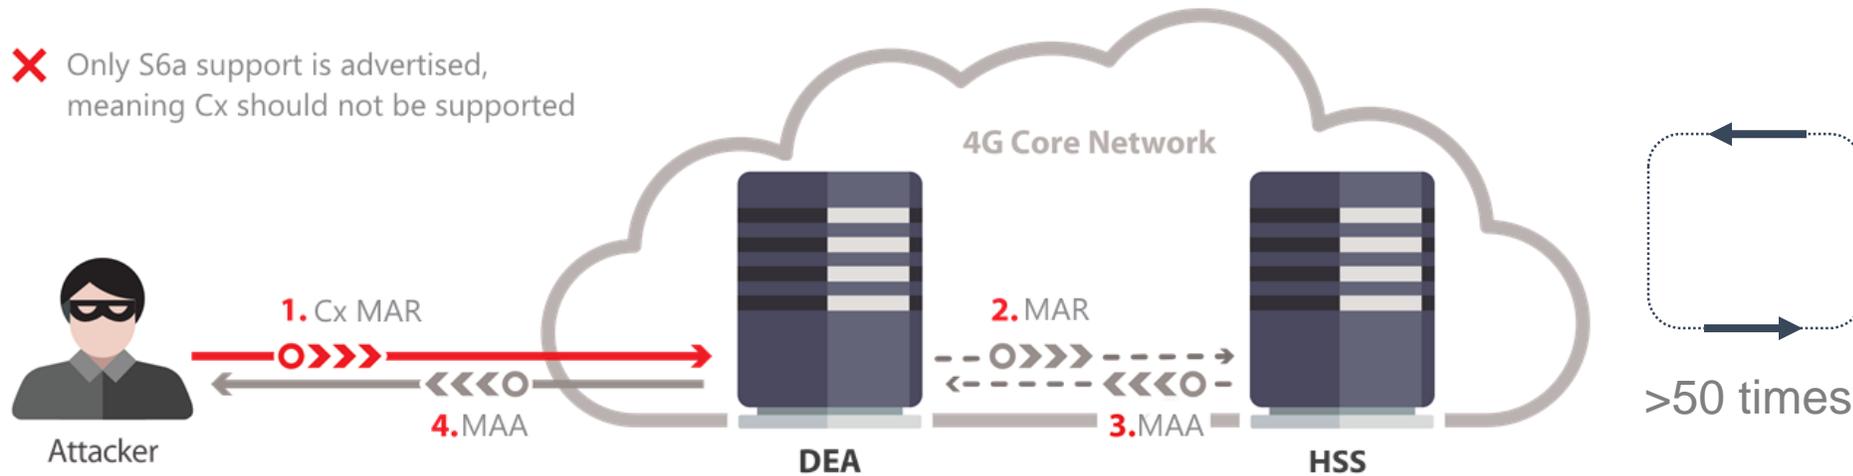

::: Reproducing **issues**

It is not enough to say "**something crashed**"

You need **working PoC**

Getting the PoC for Diameter is all about changing AVP content until you find the message causing the issue

Reproducing issues

- Reproduced during random changes in message structure
- Slowing down message sending rate "fixed" the issue
- Narrowing down types of mutations and then AVP content

::: Typical project

1. _____

Initial contact

2. _____

"We need this fast"

3. _____

**Several months
of back and forth**

4. _____

**"Get started
next week"**

5. _____

**Issues on-site (typhoon,
public holidays not
communicated, some tests
can't be done in the lab, etc.)**

6. _____

**Time for tests is
shortened / it is not
possible to do additional
tests**

::: How to deal **with clients**

-
- Ask for access to log systems and crash dumps
 - Get access to hardware vendor's representatives (may experience pushback from them)
 - Have enough time planned for investigation
 - Don't concentrate on number of messages for each separate mutation to each information element — it is better to do more tests with different parts of message being altered

::: How to deal **with clients**

1.

**Present your results
comprehensibly**

2.

**Sometimes it may be very
hard to evaluate the impact
of the finding on the spot,
ask vendor's representatives
if possible**

3.

**Have a working PoC
for the issue**

Takeaways

Decide if you need your own protocol implementation

Adapt your fuzzer to the operating conditions

Study the protocol to see where you can speed up fuzzing

Check if stateful checks are interesting to your client

Avoid breaking connection when fuzzing

Parsing of answers should be configurable

Takeaways

Create programs to test your fuzzer and then use them as emulators

Plan how to deal with fault management systems beforehand

Log everything

Include "fudge factor" in schedule to account for possible issues

Report your findings in a comprehensive way, find PoC where possible

Positive Technologies
